FABLE | AI-PERSONALISED DAILY CHECK-INS

CFO investment decision brief • Proposal: capped pilot only • All figures in USD

DECISION REQUEST

Approve a capped, randomized pilot to test whether personalised check-ins raise 180-day retention for acute-phase completers from an assumed **35% to 50%**. Do not authorize scale-up until causal lift and incremental contribution profit are demonstrated.

STRATEGIC BET & KEY ASSUMPTIONS

Personalised AI prompts improve sustained engagement and 180-day retention, creating more paying customer-months and higher contribution LTV. The load-bearing assumption is a **15 percentage-point causal retention uplift**; engagement, monetization, and incremental AI servicing costs must also be validated.

ILLUSTRATIVE UNIT ECONOMICS (NOT VERIFIED ACTUALS)

Monthly ARPU	CAC	Contribution margin	Monthly contribution
$12	$38	70%	$8.40

Per 1,000 eligible completers: 350 retained at baseline versus 500 at target = **150 additional day-180 retained users**. If all 150 are paying, this equals **$1,260/month** in contribution at day 180; $15,120 over a further 12 months *only if all remain paying throughout*. These figures exclude pilot cost and any AI costs not already in margin.

DOWNSIDE & INVESTMENT HURDLES

Scenario	Day-180 retention	Extra retained / 1,000	Monthly contribution*
Target	50%	150	$1,260
Uplift 30% below plan	45.5%	105	$882
Churn +10 percentage points	40%	50	$420

*Assumes every incrementally retained user is paying. **Simple continuous-payer CAC payback:** $38 / $8.40 = **4.5 months**; at CAC +20% ($45.60), **5.4 months**. Neither is actual churn-adjusted cohort payback. **LTV:CAC ≥3:1 is unverified**: requires ≥$114 contribution LTV at base CAC, or ≥$136.80 under CAC stress.

PILOT DESIGN, GATES & KILL CRITERION

Design: Randomize eligible completers into AI-check-in and control cohorts; track paid status, 180-day retention, monthly survival, opt-outs, incremental AI costs and contribution profit. Assess only fully matured 180-day cohorts; set sample size and budget cap before launch.

Stop / do not scale: If observed treatment retention is below **45%**, causal uplift is not credible, or the investment fails to show positive incremental contribution after AI and pilot costs, freeze further rollout spend and reallocate uncommitted funds. The 45% gate is a proposed hurdle, not evidence of profitability.

OPEN ITEMS REQUIRED FOR FINAL CFO SIGN-OFF

Pilot budget and ongoing AI cost; paying share of retained users; full monthly survival curve and post-day-180 lifetime; cohort frequency; randomized uplift and confidence interval; actual margin definition; acceptable payback and ROI hurdle. Without these, total ROI and lifetime LTV:CAC cannot be certified.
